

Here is what you need to know before upgrading:

1. About the Firmwares:

Disable Bluetooth: This firmware is universal. It works for all models (no need to distinguish between 8V5, 10V5, etc.).

Restore Bluetooth: This firmware is model-specific! Please make sure to use the correct one (8V5 and 10V5 use different firmwares).

2. How to Upgrade (No PC software needed):

The process is very easy. Depending on whether you want to disable or restore, just choose the correct firmware and follow these steps:

Step 1: Extract the RAR file and copy the update.ufw file into an empty USB flash drive.

Step 2: While the DSP is powered on and working, plug the USB drive into the U-DISK port of the DSP.

Step 3: Wait for a few seconds. You will hear a "Dong" sound from the speakers 6 times. This means the upgrade is 100% successful!

IMPORTANT NOTE:

Please **DO NOT** modify the file name of update.ufw. If the name is changed, the DSP will not be able to read the firmware.
